

Dear Ms. Savage and the WealthCounsel Hiring Team,

I'm writing to express my interest in the Junior Software Developer role at WealthCounsel. I've taken time to learn about your products, culture, and engineering team, and I'm genuinely excited about the opportunity to contribute to software that supports attorneys in delivering accurate, reliable, and high-impact legal services.

My background is centered on backend and full-stack development, where I've designed, built, and maintained scalable software systems including web applications with a strong emphasis on system correctness, data integrity, and long-term maintainability. I've worked extensively with Python, Django, FastAPI, and JavaScript/TypeScript, designing, building and maintaining REST APIs, debugging production issues, writing unit-tested code, and contributing within CI/CD-driven workflows. I approach backend development thoughtfully; considering edge cases, failure modes, and the downstream impact of system behavior.

What particularly draws me to WealthCounsel is the depth and responsibility of your products, from document-driven platforms like Wealth Docx and Elder Docx to systems supporting trust administration and asset tracking. In my previous roles, I've worked on systems involving structured workflows, reporting, task scheduling, and secure data handling. These experiences align well with maintaining and enhancing legal-focused platforms where accuracy and reliability are essential. I've also contributed to AI-assisted workflows designed to improve automation and decision support, and I'm especially mindful of applying such tools responsibly in domains where correctness and trust matter.

I'm motivated by continuous learning and collaboration, and I've had opportunities to both contribute as an individual engineer and support team execution through clear communication and ownership.

I've also followed insights shared by members of your engineering team, including Joseph Slaugh, whose commitment to continuous learning and hands-on building through certification and real-world product development reinforced my interest in WealthCounsel's growth-oriented engineering culture.

I would welcome the opportunity to contribute my skills, judgment, and strong work ethic to WealthCounsel's mission. Thank you for your time and consideration.

Sincerely,

Olaniyi George
