

ABELEJE OLANIYI GEORGE

Backend Engineer · Python · Django · FastAPI · PostgreSQL · Redis · AWS
olaniyigeorge77@gmail.com · github.com/olaniyigeorge · olaniyigeorge.vercel.app

SUMMARY

Backend engineer in my sixth year of production experience building financial systems, scalable Python services, and real-time distributed architectures using Django, FastAPI, PostgreSQL, Redis, Celery, and AWS. I specialize in financial platform design: contribution cycles, payout logic, payment gateway integrations (Paystack), idempotent transaction handling, and audit-grade state management.

I bring clean architecture discipline; domain isolation, abstract ports, event-driven workflows, without sacrificing shipping speed. My recent work spans cooperative finance systems and real-time AI platforms, both built for production reliability under live user load.

TECHNICAL SKILLS

Languages	Python, TypeScript, JavaScript
Backend	Django (DRF), FastAPI, Node.js/Express, RESTful API Design, Webhooks, Celery
Databases	PostgreSQL, Redis, MongoDB, SQLite, MySQL
Payments	Paystack, payment webhooks, idempotent transaction design, fiat on/off-ramps
Message Queues	Celery (Redis broker), BullMQ, SQS (in progress)
Cloud & DevOps	AWS (EC2, S3, RDS, SES), Docker, CI/CD pipelines, Sentry, Render, Vercel
Frontend	React, Next.js, Tailwind CSS
Other	Domain-Driven Design, WebRTC, system design, distributed systems, performance optimization, load testing.

PROFESSIONAL EXPERIENCE

Backend Engineer · [Winnov8](#)

2025 – Present

- Designed and delivered an intelligent recommendation system end-to-end — scoped with stakeholders, architected the service layer, and iterated on real production usage.
- Optimised a real-time notification and messaging system, increasing throughput by ~58% under live load through async processing and queue tuning.
- Integrated Sentry with Slack for production error monitoring and alerting, establishing observability practices across live workloads.
- Contributed to architecture decisions, code reviews, and performance tuning as the platform scaled.

Full-Stack Developer · [Revela Africa](#)

2025

- Built core financial services for a live event platform: secure payments (Paystack), ticketing flows, dynamic RSVP, and user authentication — production-ready and device-agnostic.
- Implemented Celery-based background job system (Redis broker) for email delivery, ticket generation, and hourly event reminders via Beat schedules — including task time limits, soft limits, and result expiry.
- Integrated Google APIs and payment gateways with webhooks for automated onboarding, calendar syncing, and checkout orchestration.
- Stabilised performance under peak traffic using Redis-backed service orchestration, significantly reducing response times.

Backend Engineer · [The ECO Platform](#)

2024

- Audited and refactored Django codebase — eliminated dead code, rewrote inefficient ORM query paths, and enforced clean architecture across service boundaries.
- Reduced API latency by over 91% and scaled throughput to support thousands of concurrent users through systematic query optimisation and caching.

Backend Engineer · [WispTalk Africa](#)

2023 – 2024

- Led cloud migration to AWS (S3, RDS, EC2, CloudFront), significantly improving uptime and production resilience.
- Established monitoring practices and incremental performance improvements across live workloads.

Freelance Software Developer · [Independent](#)

2020 – 2022

- Built automation pipelines, data scrapers, and backend systems for clients across industries, independently managed scoping, development, and delivery.

PROJECTS

CoopWise – Group savings & cooperative finance platform

Stack: FastAPI, PostgreSQL, Redis, Celery, Paystack, Next.js, Zustand, Gemini 1.5 Flash, Smart Contracts (Flow)

- Architected scalable backend handling the full financial lifecycle: member authentication, contribution cycles, payout scheduling, and real-time financial state management – designed with idempotent transaction handling and audit-grade event logging to ensure correctness under concurrent load.
- Integrated Paystack for fiat payments alongside Flow blockchain for on-chain governance and stablecoin escrows, enabling a hybrid fiat/Web3 payment layer for trustless group finance.
- Implemented Celery-based background jobs for scheduled contribution reminders, payout processing, and async financial state reconciliation.
- Integrated AI agents and RAG pipelines to deliver personalised financial insights; earned hackathon recognition for system design, scalability, and real-world impact.

Truefit.ai – Real-time AI voice interview platform

Stack: Python, FastAPI, WebRTC (aiortc), Gemini Live API, PostgreSQL, Redis, React, TypeScript

- Architected a dual-channel real-time system: WebSocket for session signalling and WebRTC (SRTP/UDP) for media – deliberately chosen over naive WebSocket streaming to eliminate head-of-line blocking and ensure jitter-resilient audio delivery.
- Structured Gemini as a tool-calling interview state machine with domain-driven architecture and abstract ports, giving the agent zero dependency on current infrastructure.
- Diagnosed and fixed a compound audio pipeline bug (greedy queue drain collapsing 40 chunks + pts clock reset corrupting frame pacing), resolving an infinite greeting loop that made the system unshippable.

EDUCATION

B.Sc. Computer Science · National Open University of Nigeria (*Final year, 2026*)

Professional Development, Backend Engineering · ALX Africa (*Mar 2025 – Oct 2025*)
